To Whom It May Concern:

During the spring planting season, our company utilized a new material (TerraBella) to determine if we could increase our production of green beans. This material utilizes specific strains of bacteria for the express purpose of harnessing the inherent power that the plant possesses for the metabolism of nutrients and strengthening the plant's own defenses against insect and fungal attacks.

Agreeing to try the product, our field staff was directed to apply TerraBella as instructed by the manufacturers representatives. The material was applied to 10 rows of green beans that we were planting for the spring harvest. The material was used on a contiguous block so that we could adequately compare the results of the non-treated portion against the treated area.

Much to our surprise, the treated area yielded 384 –30# boxes of green beans and the untreated area yielded 312 –30# boxes. This translates into a 23% increase in yield through the use of the product. Since we had a favorable result to our experimental use of the product, we intend to apply the product during our fall planting.

Based on the results we have obtained in our trial use of TerraBella, we are optimistic about other future results that may be realized through the application of this product to other crops that we farm.

Sincerely,

Michael Sarabian, Operations Manager
